Agenda

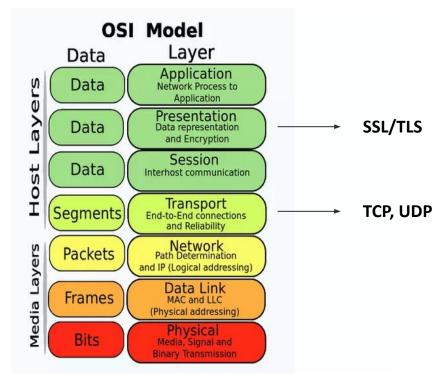

- Introduction
- Project Idea
- Implementation issues
 - Heartbleed
 - The mod_ssl attack
 - gnuTLS use after free attack
- Protocol Attacks
 - CRIME
 - POODLE
- Conclusion

Introduction

- The internet when it was initially designed, little priority was given to security.
- SSL and TLS protocols provide way to securely communicate over this insecure infrastructure.
- Four main goals:
 - Cryptographic security
 - Interoperability
 - Extensibility
 - Efficiency

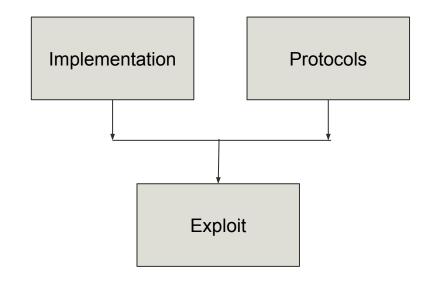

OSI Model Source: Wikimedia Commons

Project Idea

- Target the implementation mistakes that lead to a large attack surface.
- Target the protocols that lead to a large attack surface.

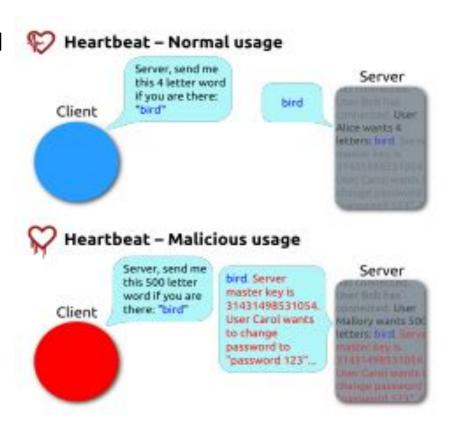

Project Idea

- Heartbleed is a vulnerability that disclosed to the public in April 2014.
- □The attack exploits the implementation of the **Heartbeat protocol**, which is a TLS protocol extension.
- It's not a cryptographic failure but failure in implementation.
- □ Lack of funding led to poor code quality.
- Fixed in OpenSSL version 1.0.1g.

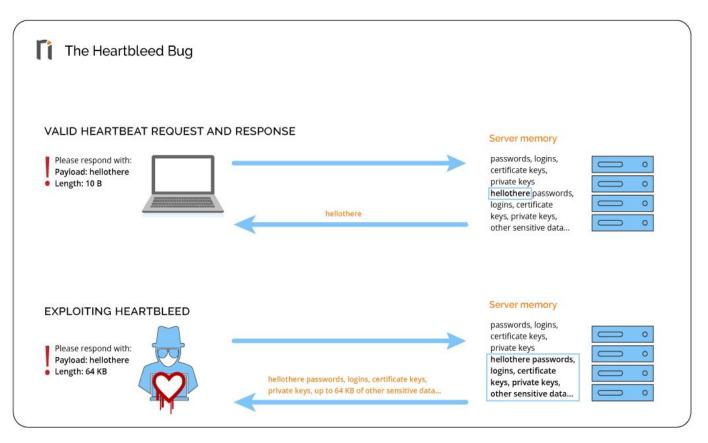

A depiction of Heartbleed Source: Wikipedia

Heartbeat protocol is generally used to negotiate and monitor the availability of a resource.

 The procedure involves sending network packets to all the nodes in the cluster to verify its reachability.

The heartbeat protocol Source: Invicti

This resulted in the leakage of some data from random memory locations on the targeted server as shown below.

```

                Sending Heartbeat ...
              - Heartbeat response, 36195 bytes
- Heartbeat response with leak, 36195 bytes
```

A depiction of Heartbleed

- The problem can be fixed by ignoring Heartbeat Request messages that ask for more data than their payload need.
- Version 1.0.1g of OpenSSL adds some bounds checks to prevent the buffer over-read.

```
if (1 + 2 + payload + 16 > s->s3->rrec.length) return 0; /* silently discard per RFC 6520 sec. 4 */
```

The mod_ssl attack

- mod_ssl is a module that provides SSL and TLS support in Apache HTTP server.
- mod_ssl prior to 2.8.7 is vulnerable to buffer overflow memory corruption attack.
- The alteration of any system file as well as enables remote code execution.

gnuTLS use after free attack

- GnuTLS is a free software implementation of the SSL/TLS protocols.
- X.509 certificate is a digital certificate
- It uses PKI standard to verify that a public key belongs to the user, computer or service identity contained within the certificate.

Digital certificate request process

Digital certificate request process Source: techtarget.com

X.509 certificate
Source: SSL.com

gnuTLS use after free attack

- certtool crashes when a malicious X.509 certificate is verified.
- Updating gnuTLS from 3.6.6 will fix the issue as in subsequent versions the *signature->data* points to *NULL* after being freed.

```
werty@outcast:~/Downloads/gnutls-3.6.6/bin$ certtool --verify-chain --infile _gnutls_x509_get_signature.pem

```

certtool crashing when verifying a malicious X.509 certificate.

```
cleanup:
    gnutls_free(signature->data); // <- pointer in datum parameter freed, but not cleared
    return result;
}</pre>
```

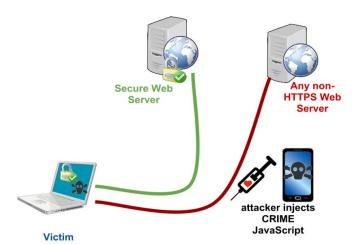

signature->data is not assigned to NULL after being freed.

Protocol Attacks

CRIME

- Compression Ratio Info-Leak Made Easy.
- Exposes cookie data to session theft.

A depiction of CRIME attack Source: hpcc.ecs.soton.ac.uk

- Protocols vulnerable to CRIME are TLS 1.0 applications that use TLS compression.
- Attacker sends multiple requests to the server.
- Observe how the compressed request payload.
- Insert Malicious content in cookie and analyze changes in size.
- The user's cookie value can be found by observing the change in length

CRIME

- CRIME can be defeated by preventing the use of compression.
- This can be done at the client end, by disabling the compression of HTTPS requests in the browser.

CRIME implementation using CBC cipher

POODLE

- Padding Oracle on Downgraded Legacy Encryption.
- This only effects SSL 3.
- This flaw enables an attacker to intercept SSLv3-encrypted traffic.

A depiction of POODLE attack Source: supportpro.com

POODLE

- nmap -sV --version-light --script ssl-poodle -p 443 example.com
- SSL 3.0 support must be disabled from both servers and browsers

```
-(kali⊕kali)-[~/testssl.sh]
 -$ nmap -sV --version-light --script ssl-poodle -p 443 portal.westermann.de

 ssl-poodle:
   VULNERABLE:
   SSL POODLE information leak
     State: LIKELY VULNERABLE
     IDs: BID:70574 CVE:CVE-2014-3566
           The SSL protocol 3.0, as used in OpenSSL through 1.0.1i and other
           products, uses nondeterministic CBC padding, which makes it easier
           for man-in-the-middle attackers to obtain cleartext data via a
           padding-oracle attack, aka the "POODLE" issue.
     Disclosure date: 2014-10-14
     Check results:
       TLS_RSA_WITH_AES_128_CBC_SHA
       TLS_FALLBACK_SCSV properly implemented

nmap enum POODLE script

Conclusion

- Do not rely on legacy versions of SSL and TLS.
- Always use the latest version of TLS.
- Regular updates and patches crucial.
- A multi-layered approach is required.
